Design Guidelines for Solar Panels and Water Cylinders for hot water supply to houses

Solar Panels / Collectors

The solar panel surrounds may be either aluminium or black in colour. The panels must be securely fastened to the roof structure taking into account the magnitude of the wind forces that are prevalent in Harbour Island.

Pitched Roofs

Only the solar panels may be mounted on a pitched roof at the same slope as the pitched roof. The water storage cylinder must be located out of sight within the roof truss space.

Flat roofs

The solar panels may be mounted on an inclined frame that is hidden behind a parapet wall. The water storage cylinder may also be located on the flat roof behind the parapet wall.

In addition to the plan of the solar water heating system that is to be submitted to Archom for approval, a brochure of the solar heating system that is to be used on a house must also be submitted to Archom for its records
